

Small Grains Specific Biostimulant by Agrovive

Agrovive's Crownfx™ Seed Treatment promotes an increase in shoot growth and tillering, resulting in more grain heads and increased yields.

Crownfx™ has been shown in actual field application to stimulate overall plant growth in small grains. Crownfx™ increases size of leaves, stronger stems and more extensive tillering.

Crownfx™

SMALL GRAIN

Crownfx™ benefits small grain by promoting faster growth and producing larger and stronger crowns and roots. Thus canopy closes faster in the field, and helps reduce losses due to heat stress. This results in more grains formed to be filled, this lead to greater overall increase in yields and profitability.

Crownfx™ also maximizes protein content in wheat and other small grains, adding value to the crop.

Crownfx™ gives growers a new tool to produce higher quality and higher yielding small grains. Crownfx™ will be a true profit maker for small grain growers.

Crownfx™ is applied as a seed coated making it cost effective, easy to use and readily adaptable to most small grain grower production operations.

Crownfx™ contains all naturally derived microorganisms, and it meets qualifications for use in organic small grain production under USDA's National Organic Program (NOP). Application and certification for use by organic small grain growers is forthcoming.

BIOPRYME™

To maximize grain yields and the benefit of Crownfx™, include BioPryme™ in your program. BioPryme™ is a nutrient and energy source to enhance microbial treatments, to help reduce the negative effects of herbicides and other pesticides on the growth and yield of small grains and other crops.
