

Sunflower Specific Biostimulant by Agrovive

Agrovive's *Hydrava*™ promotes an increase in leaf surface area of the growing plant, which results in an increase in production of carbohydrates and protein resulting in higher quality and yields of sunflower seed and oil.

Hydrava™ has been shown in field trials to produce more nectar in sunflowers, which attracts more bees. More bees means better pollination and can increase overall farm yields and profits.

Hydrava™ gives growers new tools to produce better quality and higher yielding sunflower seed and oil. *Hydrava*™ will be a true profit maker for sunflower growers.

Agrovive's *Hydrava*™ is applied foliar to sunflower plants making it easy to apply and is readily adaptable to most sunflower grower production methods.

Hydrava™ contains all naturally derived microorganisms, and it meets qualifications for use in organic sunflower production under USDA's National Organic Program (NOP). Application and certification for use by organic sunflower growers is forthcoming.

Hydra^{val}™

SUNFLOWER

Expansive sunflower leaf growth with Hydraval™

Flower head of Hydraval™ treated sunflower.

Flower head of untreated sunflower.

Sunflower plants treated with Hydraval™ in front, those in back have not.
