

Soyfx™ SOYBEANS

Copyright © 2018 Agrovive™

Soybean Specific Biostimulant by Agrovive

Agrovive's Soyfx™ Seed Treatment promotes an increase in shoot growth resulting in bigger beans on your plants and increases yields by up to 20%.

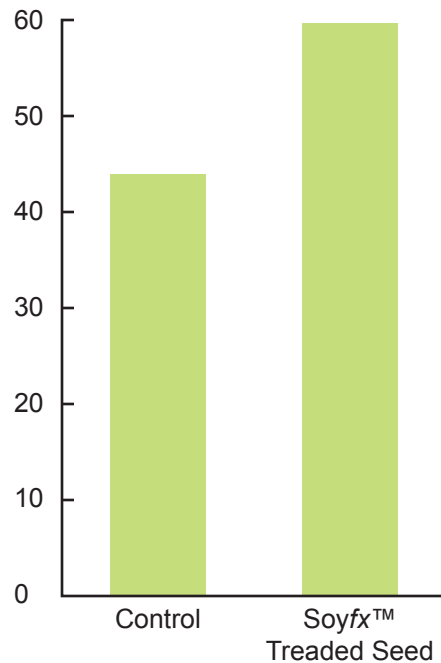

Soyfx™ has been shown in actual field application to stimulate overall plant growth in soybeans. Soyfx™ increases size of leaves, stronger stems and more extensive branching. It helps to reduce wilt caused by heat stress, resulting in bigger leaves and more robust branching. The more robust plants have increased pod counts and greater pod fill, all leading to greater overall yields and profitability.

Soyfx™ gives growers a new tool to produce higher quality and higher yielding soybeans. Soyfx™ will be a true profit maker for forage growers.

Soyfx™ is applied as a seed coated making it cost effective, easy to use and readily adaptable to most soybean grower production operations.

Soyfx™ contains all naturally derived microorganisms, and it meets qualifications for use in organic soybean production under USDA's National Organic Program (NOP). Application and certification for use by organic soybean growers is forthcoming.

BIOPRYME™

To maximize pod fill and the benefit of Soyfx™, include BioPryme™ in your program. BioPryme™ is a nutrient and energy source to enhance microbial treatments, to help reduce the negative effects of herbicides and other pesticides on growth and yields of soybeans and other crops.
